

Trolley Loader type TL 2011

Single front for pre-packed product.

Typical application

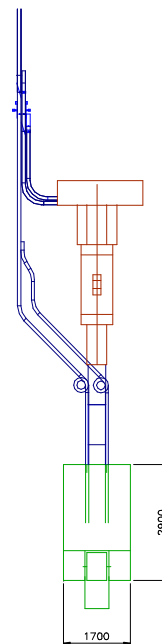

To be used for inserting pre-packaged products, either wrapped or boxed, into all types of Roll Cage Trolleys or Dolly's, with or without shelves, either in single or multi layer configurations. Layer Pad insertion is optionally available. In general, the trolley loader will create and pack a profile maximising the available storage area within the Trolley.

Process

The product is pre-grouped onto a tongue insertion plate. If used the layer pad is inserted at this stage. The pack is transferred into the trolley and a backstop extended to remove the load. During this sequence the next pack profile is being pre-grouped. The insertion plate returns picks up the load and indexes to the next loading height. The Trolley remains fixed and static throughout the entire operation. When full the operator replaces the full Trolley in one continuous operation protected by light curtain technology, with "new trolley present" detected automatically.

Features

- All stainless materials
- Layer Pad Insertion as an option.
- Packs with or without shelves
- Packs both boxed or wrapped products
- Adaptable to fit most end of line packaging operations
